2.4 Features and constraints	6
2.4.1 Prerequisite courses	6
2.4.2 Credit limit	7
2.4.3 Time conflicts	7
3. Conclusion	8

## 1. Introduction

Project 2 requires students to design and implement a DB-based partial application on Teaching Administration Management, and mainly implement Select-Courses with necessary helper features (view selectable courses and selected courses, adjust selected courses etc.), considering the following constraints: prerequisite courses, credit limit (no more than 21 credits in one semester), and no time conflicts for selected courses.

## 2. Project description

#### 2.1 Environment

For this project, some following tools/frameworks are being used:

IDE: IntelliJ IDEA 2020.3 x64;

Server: *Tomcat 9.0.41*; Database: *MySQL 8.0.21*; Language: *JAVA JDK 1.8*,

If configured correctly, the program can be compiled and run directly under IDEA.

#### 2.2 Default Settings

JDBC: The default ID and password are "root". If they are not applicable, please change your MySQL settings or modify the code in file *TeachManage-src\src\dao\CommDAO.java* 

Administrator: The default ID and password are "admin". Student: The default ID is "2018052755", password is "000".

#### 2.3 Overview

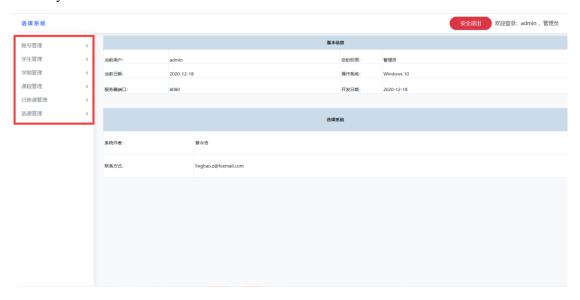

The main interface when first running.

I divided this system into two parts: the administration part and the student part. The two parts are discussed respectively below.

#### **Administrator:**

The user should see that there are many operationable sections, including account mangement, students mangement, semesters mangement, courses management, finished courses management and selected courses management. This report only focuses on the most important features and will only describe a few sections.

## Students management:

In this section, the administrator can add or delete students.

#### Courses management:

In this section, the administrator can add courses and check courses.

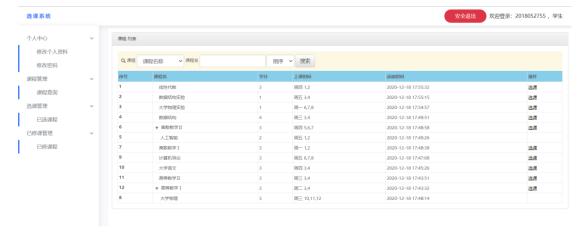

Press and hold shift button to multi-select.

A course with an arrow means it is a prerequisite for the following courses, the administrator can enter the student's grade, which means that the student has completed the prerequisite course, so he/she can continue to select the next course.

#### **Student:**

The student can select course and view selected course and finished courses. Also, this system has sections including personal center which can modify personal information.

#### 2.4 Features and constraints

## 2.4.1 Prerequisite courses

Students cannot take a course that requires a prerequisite until the prerequisite is graded by the administrator.

#### Example:

① The student selects the course "Discrete Mathematics II".

② The administrator grades this course.

③ The course "Artificial Intelligence" is selectable.

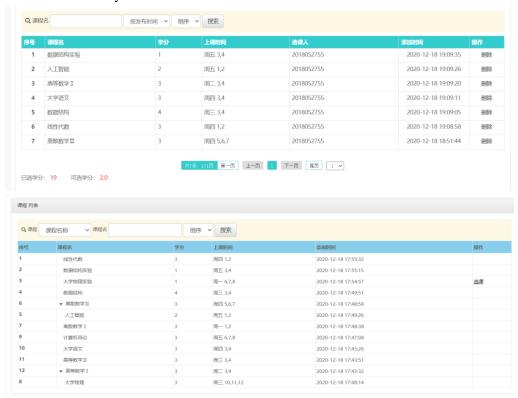

#### 2.4.2 Credit limit

The student cannot select courses if credits is over 21.

#### Example:

The student has only two credits left so that other courses that are over 2 cannot be selected.

#### 2.4.3 Time conflicts

The student cannot select course if there are time conflicts.

## Example:

The time of course "Data Structures" and "Advanced Mathematics II" have conflicts. The student selects "Data Structures" so "Advanced Mathematics II" cannot be selected.

## 3. Conclusion

Although there are still many shortcomings through the development process of this teaching administration management system, I have strengthened my understanding of the overall layout and logic of the project during the design process, as well as deepened my understanding about web application development and database systems.
